## Rough paths methods 2: Young integration

Samy Tindel

Purdue University

University of Aarhus 2016

#### Outline

- Some basic properties of fBm
- Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

#### Outline

- Some basic properties of fBm
- Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

#### Definition of fBm

Complete probability space:  $(\Omega, \mathcal{F}, \mathbf{P})$ 

#### Definition 1.

A 1-d fBm is a continuous process  $B = \{B_t; t \ge 0\}$  such that:

- $B_0 = 0$
- B is a centered Gaussian process  $\mathbf{E}[B_tB_s]=\frac{1}{2}(|s|^{2H}+|t|^{2H}-|t-s|^{2H})$ , for  $H\in(0,1)$

d-dimensional fBm:  $B = (B^1, \dots, B^d)$ , with  $B^i$  independent 1-d fBm

#### fBm: variance of the increments

Notation: If  $f:[0,T]\to\mathbb{R}^d$  is a function, we shall denote:

$$\delta f_{\mathsf{st}} = f_{\mathsf{t}} - f_{\mathsf{s}}, \quad \text{ and } \quad \|f\|_{\mu} = \sup_{s,t \in [0,T]} \frac{|\delta f_{\mathsf{st}}|}{|t-s|^{\mu}}$$

Variance of the increments: for a 1-d fBm,

$$\mathbf{E}[|\delta B_{st}|^2] \equiv \mathbf{E}[|B_t - B_s|^2] = |t - s|^{2H}$$

### FBm regularity

Proposition 2. FBm  $B \equiv B^H$  is  $\gamma$ -Hölder continuous on [0,T] for all  $\gamma < H$ , up to modification.

Proof: We have  $\delta B_{st} \sim \mathcal{N}(0, |t-s|^{2H})$ . Thus for n > 1,

$$\mathbf{E}\left[|\delta B_{st}|^{2n}\right] = c_n|t-s|^{2Hn}$$
 i.e  $\mathbf{E}\left[|\delta B_{st}|^{2n}\right] = c_n|t-s|^{1+(2Hn-1)}$ 

Kolmogorov: B is  $\gamma$ -Hölder for  $\gamma < (2Hn - 1)/2n = H - 1/(2n)$ . Proof finished by letting  $n \to \infty$ .

## Some properties of fBm

#### Proposition 3.

Let B be a fBm with parameter H. Then:

- ②  $\{B_{t+h} B_h; t \ge 0\}$  is a fBm (stationarity of increments)
- **3** B is not a semi-martingale unless H = 1/2

#### Proof of claim 3

#### Semi-martingale and quadratic variation:

If B were a semi-martingale, we would get on [0,1]:

$$\mathbf{P} - \lim_{n \to \infty} \sum_{i=1}^{n} (B_{i/n} - B_{(i-1)/n})^2 = \langle B \rangle_1,$$

were  $\langle B \rangle$  is the (non trivial) quadratic variation of B.

We will show that  $\langle B \rangle$  is trivial (0 or  $\infty$ ) whenever  $H \neq 1/2$ .

◆ロト ◆団ト ◆豆ト ◆豆 ・ りへで

# Proof of claim 3 (2)

A p-variation: Define

$$V_{n,p} = \sum_{i=1}^{n} |B_{i/n} - B_{(i-1)/n}|^p$$
, and  $Y_{n,p} = n^{pH-1}V_{n,p}$ .

By scaling properties, we have:

$$Y_{n,p} \stackrel{(d)}{=} \hat{Y}_{n,p}, \quad \text{with} \quad \hat{Y}_{n,p} = n^{-1} \sum_{i=1}^{n} |B_i - B_{i-1}|^p.$$

The sequence  $\{B_i - B_{i-1}; i \ge 1\}$  is stationary and mixing  $\Rightarrow \hat{Y}_{n,p}$  converges  $\mathbf{P} - a.s$  and in  $L^1$  towards  $\mathbf{E}[|B_1 - B_0|^p]$   $\Rightarrow \mathbf{P} - \lim_{n \to \infty} Y_{n,p} = E[|B_1|^p]$   $\Rightarrow \mathbf{P} - \lim_{n \to \infty} V_{n,p} = 0$  if pH > 1,  $\infty$  if pH < 1

**◆ロト→御ト→きト→き** → 9へ(~)

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 9 / 74

# Proof of claim 3 (3)

Recall: 
$$V_{n,p} = \sum_{i=1}^{n} |B_{i/n} - B_{(i-1)/n}|^p$$

Definition:  $\mathbf{P} - \lim_{n \to \infty} V_{n,p}^{1/p} \equiv \mathcal{V}_p(B)$  is called *p*-variation of  $B \Rightarrow We$  have seen  $\mathcal{V}_p(B) = 0$  if pH > 1,  $\infty$  if pH < 1

Property: if 
$$p_1 < p_2$$
, then  $\mathcal{V}_{p_1}(B) \geq \mathcal{V}_{p_2}(B)$ 

Case 
$$H > 1/2$$
: choose  $p < 2$  such that  $pH > 1$   
 $\Rightarrow V_p(B) = 0 \Rightarrow V_2(B) = 0$ 

Case 
$$H < 1/2$$
: choose  $p > 2$  such that  $pH < 1$   
 $\Rightarrow \mathcal{V}_p(B) = \infty \Rightarrow \mathcal{V}_2(B) = \infty$ 

Conclusion: if  $H \neq 1/2$ , Itō's type methods do not apply in order to define stochastic integrals

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 10 / 74

### Outline

- Some basic properties of fBm
- Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

# Strategy for H > 1/2

- Generally speaking, take advantage of two aspects of fBm:
  - Gaussianity
  - Regularity

For H > 1/2, regularity is almost sufficient

- Notation:  $\mathcal{C}_1^{\gamma}=\mathcal{C}_1^{\gamma}(\mathbb{R})\equiv \gamma$ -Hölder functions of 1 variable
- If H>1/2,  $B\in \mathcal{C}_1^{\gamma}$  for any  $1/2<\gamma< H$  a.s
- We shall try to solve our equation in a pathwise manner

### Equation under consideration

$$X_t = a + \int_0^t \sigma(X_s) dB_s + \int_0^t b(X_s) ds, \quad t \in [0, T]$$
 (1)

- $a \in \mathbb{R}^n$  initial condition
- b,  $\sigma$  coefficients in  $C_b^1$
- $B = (B^1, \dots, B^d)$  d-dimensional Brownian motion
- B<sup>i</sup> iid Brownian motions

### Notational simplification

Simplified setting: In order to ease notations, we shall consider:

- Real-valued solution and fBm: n = d = 1. However, we shall use d-dimensional methods
- b ≡ 0

Simplified equation: we end up with

$$X_t = a + \int_0^t \sigma(X_s) dB_s, \quad t \in [0, T]$$
 (2)

- $a \in \mathbb{R}$ ,  $\sigma \in C_b^1(\mathbb{R})$
- B is a 1-d Brownian motion

### Pathwise strategy

Aim: Let x be a function in  $C_1^{\gamma}$  with  $\gamma > 1/2$ . We wish to define and solve an equation of the form:

$$y_t = a + \int_0^t \sigma(y_s) \, dx_s \tag{3}$$

#### Steps:

- Define an integral  $\int z_s \, dx_s$  for  $z \in \mathcal{C}_1^{\kappa}$ , with  $\kappa + \gamma > 1$
- Solve (3) through fixed point argument in  $\mathcal{C}_1^{\kappa}$  with  $1/2 < \kappa < \gamma$

Notation: We set

$$\mathcal{J}_{st}(z\,dx)="\int_s^t z_w dx_w"$$

for reasonable extensions of Riemann's integral

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● めぬ◎

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 15 / 74

#### Particular Riemann sums

Aim: Define  $\int_0^1 z_s dx_s$  for  $z \in \mathcal{C}_1^{\kappa}$ ,  $x \in \mathcal{C}_1^{\gamma}$ , with  $\kappa + \gamma > 1$ 

Dyadic partition: set  $t_i^n = i/2^n$ , for  $n \ge 0$ ,  $0 \le i \le 2^n$ 

Associated Riemann sum:

$$I_n \equiv \sum_{i=0}^{2^n-1} z_{t_i^n} [x_{t_{i+1}^n} - x_{t_i^n}] = \sum_{i=0}^{2^n-1} z_{t_i^n} \, \delta x_{t_i^n t_{i+1}^n}.$$

Question: Can we define  $\mathcal{J}_{01}(z dx) \equiv \lim_{n \to \infty} I_n$ ?

Possibility: Control  $|I_{n+1} - I_n|$  and write (if the series is convergent):

$$\mathcal{J}_{01}(z\,dx)=I_0+\sum_{n=0}^{\infty}(I_{n+1}-I_n).$$

◆ロト ◆御 ト ◆ 恵 ト ◆ 恵 ・ 夕 Q ②

16 / 74

Samy T. (Purdue) Rough Paths 2 Aarhus 2016

### Control of $I_{n+1} - I_n$

We have:

$$\begin{split} I_n &= \sum_{i=0}^{2^n-1} z_{t_i^n} \, \delta x_{t_i^n t_{i+1}^n} = \sum_{i=0}^{2^n-1} z_{t_{2i}^{n+1}} \left[ \delta x_{t_{2i}^{n+1} t_{2i+1}^{n+1}} + \delta x_{t_{2i+1}^{n+1} t_{2i+2}^{n+1}} \right] \\ I_{n+1} &= \sum_{i=0}^{2^n-1} \left[ z_{t_{2i}^{n+1}} \, \delta x_{t_{2i}^{n+1} t_{2i+1}^{n+1}} + z_{t_{2i+1}^{n+1}} \, \delta x_{t_{2i+1}^{n+1} t_{2i+2}^{n+1}} \right] \end{split}$$

Therefore:

$$\begin{aligned} |I_{n+1} - I_n| &= \left| \sum_{i=0}^{2^n - 1} \delta z_{t_{2i}^{n+1} t_{2i+1}^{n+1}} \delta x_{t_{2i+1}^{n+1} t_{2i+2}^{n+1}} \right| \\ &\leq \sum_{i=0}^{2^n - 1} \|z\|_{\kappa} |t_{2i+1}^{n+1} - t_{2i}^{n+1}|^{\kappa} \|x\|_{\gamma} |t_{2i+2}^{n+1} - t_{2i+1}^{n+1}|^{\gamma} \\ &= \frac{\|z\|_{\kappa} \|x\|_{\gamma}}{2^{\kappa + \gamma} 2^{n(\kappa + \gamma - 1)}} \end{aligned}$$

# Definition of the integral

We have seen: for  $\alpha \equiv \kappa + \gamma - 1 > 0$  and  $n \geq 0$ :

$$|I_{n+1}-I_n|\leq \frac{c_{x,z}}{2^{\alpha n}}$$

#### Series convergence:

Obviously,  $\sum_{n=0}^{\infty} (I_{n+1} - I_n)$  is a convergent series  $\hookrightarrow$  yields definition of  $\mathcal{J}_{01}(z \, dx)$ , and more generally:  $\mathcal{J}_{st}(z \, dx)$ 

#### Remark:

One should consider more general partitions  $\pi$ , with  $|\pi| \to 0$   $\hookrightarrow$  C.f Lejay (Séminaire 37)

# Young integral, version 1

#### **Proposition 4.**

Let  $z \in \mathcal{C}_1^{\kappa}([0,T]), x \in \mathcal{C}_1^{\gamma}([0,T])$ , with  $\kappa + \gamma > 1$ , and  $0 \le s < t \le T$ . Let

- $(\pi_n)_{n\geq 0}$  a sequence of partitions of [s,t] such that  $\lim_{n\to\infty}|\pi_n|=0$
- In corresponding Riemann sums

#### Then:

- **1** I<sub>n</sub> converges to an element  $\mathcal{J}_{st}(z dx)$
- ② The limit does not depend on the sequence  $(\pi^n)_{n\geq 0}$
- **1** Integral linear in z, and coincides with Riemann's integral for smooth z, x

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 19 / 74

### Outline

- Some basic properties of fBm
- 2 Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

#### Notations: increments

Simplex: For  $k \ge 2$  and T > 0 we set

$$S_{k,T} = \{(s_1, \ldots, s_k); 0 \le s_1 < \cdots < s_k \le T\}$$

(k-1)-increment: Let T > 0, a vector space V and  $k \ge 1$ :

$$\mathcal{C}_k(V) \equiv \left\{ g \in \mathcal{C}(\mathcal{S}_{k,T}; V); \ \lim_{t_i \to t_{i+1}} g_{t_1 \cdots t_k} = 0, \ i \leq k-1 \right\}$$

Remark: We mostly consider  $V = \mathbb{R}$  for notational sake  $\hookrightarrow$  We write  $\mathcal{C}_k = \mathcal{C}_k([0, T]; \mathbb{R})$

### Notations: operator $\delta$

#### Operator $\delta$ :

$$\delta: \mathcal{C}_k o \mathcal{C}_{k+1}, \qquad \delta g_{t_1\cdots t_{k+1}} = \sum_{i=1}^{k+1} (-1)^{k-i} g_{\hat{\mathbf{t}}_i^{k+1}},$$

where

$$\mathbf{\hat{t}}^{k+1} = (t_1, \dots, t_{k+1}) 
\mathbf{\hat{t}}_i^{k+1} = (t_1, \dots, t_{i-1}, t_{i+1}, \dots, t_{k+1})$$

Examples: if  $g \in \mathcal{C}_1$  and  $h \in \mathcal{C}_2$  we have, for  $s, u, t \in \mathcal{S}_{3,T}$ ,

$$\delta g_{st} = g_t - g_s$$
, and  $\delta h_{sut} = h_{st} - h_{su} - h_{ut}$ .

- 4 ロ ト 4 個 ト 4 差 ト 4 差 ト - 差 - からぐ

# First properties of $\delta$

#### Proposition 5.

$$\delta\delta:\mathcal{C}_k o\mathcal{C}_{k+2}$$
 satisfies  $\delta\delta=0$ 

Notation:  $\mathcal{ZC}_k = [\mathcal{C}_k \cap \mathsf{Ker}\delta]$ 

#### Proposition 6.

Let

- k > 1
- $h \in \mathcal{ZC}_{k+1}$

There exists a (non unique)  $f \in \mathcal{C}_k$  such that  $h = \delta f$ .

#### **Proofs**

Proposition 5, easy case: If k = 1,  $g \in C_1$  and  $h \equiv \delta g$ , then:

$$(\delta \delta g)_{sut} = \delta h_{sut} = h_{st} - h_{su} - h_{ut}$$

$$= [g_t - g_s] - [g_u - g_s] - [g_t - g_u]$$

$$= 0$$

# Proofs (2)

Proposition 5, general case: Let  $g \in C_k$ . Then:

$$(\delta \delta g)_{\mathbf{t}^{k+2}} = \sum_{i=1}^{k+2} (-1)^{k+1-i} \delta g_{\hat{\mathbf{t}}_{i}^{k+2}}$$

$$= \sum_{i=1}^{k+1} (-1)^{k+1-i} \delta g_{\hat{\mathbf{t}}_{i}^{k+2}} - \delta g_{\mathbf{t}^{k+1}}$$
(4)

Decomposition for  $\hat{\mathbf{t}}_i^{k+2}$ : Write  $\hat{\mathbf{t}}_i^{k+2} = \mathbf{s}^{k+1}$ . Then

$$s_j = t_j$$
 if  $j \le i - 1$ , and  $s_j = t_{j+1}$  if  $j \ge i$ .

⟨□⟩ ⟨□⟩ ⟨≡⟩ ⟨≡⟩ ⟨≡⟩ ⟨□⟩ ⟨□⟩

# Proofs (3)

Computation of  $\delta g_{\hat{\mathbf{t}}^{k+2}}$ : For  $i \leq k+1$  we have

$$\delta g_{\hat{\mathbf{t}}_{i}^{k+2}} = \delta g_{\mathbf{s}^{k+1}} = \sum_{j=1}^{k+1} (-1)^{k-j} g_{\hat{\mathbf{s}}_{j}^{k+1}} 
= \sum_{j=1}^{i-1} (-1)^{k-j} g_{\hat{\mathbf{t}}_{j,i}^{k+2}} + \sum_{j=i}^{k+1} (-1)^{k-j} g_{\hat{\mathbf{t}}_{i,j+1}^{k+2}} 
= \sum_{j=1}^{i-1} (-1)^{k-j} g_{\hat{\mathbf{t}}_{j,i}^{k+2}} + \sum_{j=i+1}^{k+2} (-1)^{k-j+1} g_{\hat{\mathbf{t}}_{i,j}^{k+2}} 
= \sum_{j=1}^{i-1} (-1)^{k-j} g_{\hat{\mathbf{t}}_{j,i}^{k+2}} + \sum_{j=i+1}^{k+1} (-1)^{k-j+1} g_{\hat{\mathbf{t}}_{i,j}^{k+2}} - g_{\hat{\mathbf{t}}_{i}^{k+1}}$$

# Proofs (4)

Conclusion for Proposition 5: Plugging (5) into (4), we get

$$(\delta \delta g)_{\mathbf{t}^{k+2}} = \sum_{i=1}^{k+1} (-1)^{k+1-i} \left[ \sum_{j=1}^{i-1} (-1)^{k-j} g_{\hat{\mathbf{t}}_{j,i}^{k+2}} + \sum_{j=i+1}^{k+1} (-1)^{k-j+1} g_{\hat{\mathbf{t}}_{i,j}^{k+2}} \right]$$

$$+ \sum_{i=1}^{k+1} (-1)^{k-i} g_{\hat{\mathbf{t}}_{i}^{k+1}} - \delta g_{\mathbf{t}^{k+1}}$$

$$= \sum_{1 \le j < i \le k+1} (-1)^{i+j-1} g_{\hat{\mathbf{t}}_{j,i}^{k+2}} + \sum_{1 \le i < j \le k+1} (-1)^{i+j} g_{\hat{\mathbf{t}}_{i,j}^{k+2}}$$

$$+ \delta g_{\mathbf{t}^{k+1}} - \delta g_{\mathbf{t}^{k+1}}$$

$$= 0$$

4□ > 4₫ > 4½ > ½ > ½
 9

# Proofs (5)

Proposition 6, strategy: We show that the following works:

$$f_{t_1...t_k} = -h_{t_1\cdots t_kT}$$

Relation  $\delta h = 0$ : can be written as

$$\delta h_{\mathbf{t}^{k+2}} = \sum_{i=1}^{k+1} (-1)^{k+1-i} h_{\hat{\mathbf{t}}_{i}^{k+2}} - h_{\mathbf{t}^{k+1}} = 0$$
 (6)

Verification of our claim: Set  $g_{t_1...t_k} = h_{t_1...t_k} = -f_{t_1...t_k}$ . Then

$$\delta g_{\mathbf{t}^{k+1}} = \sum_{i=1}^{k+1} (-1)^{k-i} g_{\hat{\mathbf{t}}_{i}^{k+1}} = \sum_{i=1}^{k+1} (-1)^{k-i} h_{\hat{\mathbf{t}}_{i}^{k+1} T} \\
= -\sum_{i=1}^{k+1} (-1)^{k+1-i} h_{\hat{\mathbf{t}}_{i}^{k+1} T} \stackrel{\text{(6)}}{=} -h_{\mathbf{t}^{k+1}}$$

| Samy T. (Purdue) | Rough Paths 2 | Aarhus 2016 | 28 / 74

### Particular case of Proposition 6

#### **Proposition 7.**

#### Let

•  $h \in \mathcal{ZC}_2$ 

#### Then

- There exists  $f \in C_1$  such that  $h = \delta f$ .
- $\bullet$  f is unique up to a constant

#### Proof of existence:

Take  $f_s = -h_{sT}$  as in the general case.

#### Proof of uniqueness:

A function f defined by its increments is unique up to a constant.

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 29 / 74

### First relation with integrals

#### **Proposition 8.**

Let f and g two smooth functions on [0, T]. Define  $I \in \mathcal{C}_2$  by

$$I_{st} = \int_{s}^{t} \left( \int_{s}^{v} df_{w} \right) dg_{v}, \quad \text{ for } \quad s,t \in [0,T].$$

Then we have, for s < u < t:

$$\delta I_{sut} = [f_u - f_s][g_t - g_u] = \delta f_{su} \, \delta g_{ut}.$$

#### Remark: This elementary property is important:

- ullet  $\delta$  transforms integrals into products of increments.
- We have already seen that products of the type  $\delta f \delta g$   $\hookrightarrow$  both regularities of f and g can be used.

### Proof

Invoking the very definition of  $\delta$  and I:

$$\begin{split} &(\delta I)_{sut} = I_{st} - I_{su} - I_{ut} \\ &= \int_{s}^{t} \left( \int_{s}^{v} df_{w} \right) dg_{v} - \int_{s}^{u} \left( \int_{s}^{v} df_{w} \right) dg_{v} - \int_{u}^{t} \left( \int_{u}^{v} df_{w} \right) dg_{v} \\ &= \int_{u}^{t} \left( \int_{s}^{v} df_{w} \right) dg_{v} - \int_{u}^{t} \left( \int_{u}^{v} df_{w} \right) dg_{v} \\ &= \int_{u}^{t} \left( \int_{s}^{u} df_{w} \right) dg_{v} \\ &= \left( \int_{s}^{u} df_{w} \right) \left( \int_{u}^{t} dg_{v} \right) = \delta f_{su} \delta g_{ut} \end{split}$$

31 / 74

Samy T. (Purdue) Rough Paths 2 Aarhus 2016

### Hölder spaces

Aim: take into account some regularities in  $C_k$ .

Case k=2: if  $f \in C_2$ , set

$$\|f\|_{\mu} = \sup_{(s,t) \in \mathcal{S}_{2,T}} \frac{|f_{st}|}{|t-s|^{\mu}}, \quad \text{and} \quad \mathcal{C}_2^{\mu} = \{f \in \mathcal{C}_2; \ \|f\|_{\mu} < \infty\}.$$

Case k=1: if  $g \in C_1$ , set

$$\|g\|_{\mu}=\|\delta g\|_{\mu},\quad \text{and}\quad \mathcal{C}_1^{\mu}=\left\{g\in\mathcal{C}_1;\,\|g\|_{\mu}<\infty\right\}.$$

Remark:  $\|\cdot\|_{\mu}$  defines a semi-norm in  $\mathcal{C}_{1}^{\mu}$ . It is a norm on

$$\mathcal{C}_{1,a}^{\mu} = \{g: [0,T] \to \mathbb{R}; g_0 = a, \|g\|_{\mu} < \infty\}$$

◆ロト ◆御 ト ◆ 恵 ト ◆ 恵 ・ 釣 へ ○

# Hölder spaces (2)

Case k=3: if  $h \in C_3$ , set

$$||h||_{\mu} = \sup_{(s,u,t)\in\mathcal{S}_{3,T}} \frac{|h_{sut}|}{|t-s|^{\mu}}$$

and

$$\mathcal{C}_3^{\mu} = \left\{ h \in \mathcal{C}_3; \ \|h\|_{\mu} < \infty \right\}.$$

# Operator $\Lambda$ (Sewing map)

#### Theorem 9.

Let  $\mu>1$ . There exists a unique linear application  $\Lambda:\mathcal{ZC}_3^\mu\to\mathcal{C}_2^\mu$  such that

$$\delta \Lambda = \operatorname{Id}_{\mathcal{Z}\mathcal{C}_3^\mu} \quad \text{ and } \quad \Lambda \delta = \operatorname{Id}_{\mathcal{C}_2^\mu}.$$

Equivalent statement: for any  $h \in \mathcal{C}_3^{\mu}$  such that  $\delta h = 0$ ,

there exists a unique element  $g=\Lambda(h)\in\mathcal{C}_2^\mu$  such that  $\delta g=h.$ 

Furthermore, for any  $\mu>1$ , the application  $\Lambda$  is continuous from  $\mathcal{ZC}_3^\mu$  to  $\mathcal{C}_2^\mu$ , and

$$\|\Lambda h\|_{\mu} \leq \frac{1}{2^{\mu}-2}\|h\|_{\mu}, \qquad h \in \mathcal{Z}\mathcal{C}_3^{\mu}.$$

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 34 / 74

# Second relation with integrals

#### Proposition 10.

Let  $g\in\mathcal{C}_2$ , such that  $\delta g\in\mathcal{C}_3^\mu$  with  $\mu>1$ . Define

$$k = (\mathrm{Id} - \Lambda \delta)g$$

Then

$$k_{st} = \lim_{|\Pi_{st}| \to 0} \sum_{i=0}^{n} g_{t_i t_{i+1}},$$

as  $|\Pi_{st}| o 0$ , where  $\Pi_{st}$  is a partition of [s,t].

Interpretation: Increment k can be seen as an integral of g.

◆ロト ◆個ト ◆差ト ◆差ト 差 めなべ

 Samy T. (Purdue)
 Rough Paths 2
 Aarhus 2016
 35 / 74

### Proof of Proposition 10

An equation for g: Thanks to Proposition 7, we have

$$k = (Id - \Lambda \delta)g \implies \delta k = 0 \implies k = \delta f$$

for  $f \in C_1$  unique up to a constant. Thus:

$$g = \delta f + \Lambda \delta g \tag{7}$$

Conclusion: Thanks to (7) we have

$$S_{\Pi} = \sum_{i=0}^{n} g_{t_{i}t_{i+1}} = \sum_{i=0}^{n} \delta f_{t_{i}t_{i+1}} + \sum_{i=0}^{n} (\Lambda \delta g)_{t_{i}t_{i+1}} = \delta f_{st} + \sum_{i=0}^{n} (\Lambda \delta g)_{t_{i}t_{i+1}}.$$

Then the last sum converges to zero, since  $\Lambda \delta g \in \mathcal{C}^{1+}_3(V)$ 

◆ロト ◆個ト ◆差ト ◆差ト 差 めなべ

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 36 / 74

### Young integral: strategy

Smooth case: Let  $f, g \in \mathcal{C}_1^1$ . Define  $I \in \mathcal{C}_2$  by

$$I_{st} = \int_{s}^{t} \left( \int_{s}^{v} df_{w} \right) dg_{v}, \quad \text{ for } \quad s,t \in [0,T].$$

Decomposition-recomposition scheme: we have

$$I = \int df \int dg \xrightarrow{\delta} (\delta f) (\delta g) \xrightarrow{\Lambda} I = \int df \int dg.$$

#### Indeed:

- First step: already established.
- Second step:  $(\delta f)(\delta g) \in \mathcal{ZC}_3^{\mu}$  with  $\mu > 1 \Longrightarrow$  Proposition 9

Important: Second step can be extended to more irregular situations  $\hookrightarrow f \in \mathcal{C}_1^{\gamma}, g \in \mathcal{C}_1^{\kappa}$  with  $\mu = \gamma + \kappa > 1$ .

### Operator $\Lambda$ (repeated)

#### Theorem 11.

Let  $\mu>1.$  There exists a unique linear application  $\Lambda:\mathcal{ZC}_3^\mu\to\mathcal{C}_2^\mu$  such that

$$\delta \Lambda = \operatorname{Id}_{\mathcal{Z}\mathcal{C}_3^\mu} \quad \text{ and } \quad \Lambda \delta = \operatorname{Id}_{\mathcal{C}_2^\mu}.$$

Equivalent statement: for any  $h \in \mathcal{C}_3^{\mu}$  such that  $\delta h = 0$ ,

there exists a unique element  $g=\Lambda(h)\in\mathcal{C}_2^\mu$  such that  $\delta g=h.$ 

Furthermore, for any  $\mu>1$ , the application  $\Lambda$  is continuous from  $\mathcal{ZC}_3^\mu$  to  $\mathcal{C}_2^\mu$ , and

$$\|\Lambda h\|_{\mu} \leq \frac{1}{2^{\mu}-2}\|h\|_{\mu}, \qquad h \in \mathcal{ZC}_3^{\mu}.$$

4日ト 4個ト 4 差ト 4 差ト 差 りなべ

### Operator A: uniqueness

#### Definition of 2 increments:

Let  $M, \hat{M}$  be two elements in  $\mathcal{C}_2^{\mu}$  such that  $\delta M = \delta \hat{M} = h$ .

Define  $Q = M - \hat{M}$ .

Then  $\delta Q=0$  and  $Q\in \mathcal{C}_2^\mu.$ 

#### Contradiction:

Hence there exists an element  $q \in \mathcal{C}_1$  such that  $Q = \delta q$ , and

$$|q_t-q_s|=|Q_{st}|\leq c|t-s|^\mu$$

Since  $\mu > 1$ , q is constant in [0, T], and thus Q = 0.

- ◆ロト ◆御 ト ◆ 恵 ト ◆ 恵 ・ 夕 Q @

### Operator A: existence

#### Algebraic increment:

 $\delta h = 0 \Rightarrow$  existence of  $B \in \mathcal{C}_2$  such that  $\delta B = h$ .

#### Construction of a sequence:

Called  $M_{st}^n$ , defined for  $s, t \in [0, T]$ , with s < t

For  $n \ge 0$ , consider partition  $\{r_i^n; i \le 2^n\}$  of [s, t], where

$$r_i^n = s + \frac{(t-s)i}{2^n}$$
, for  $0 \le i \le 2^n$ .

For  $n \ge 0$ , define

$$M_{st}^n = B_{st} - \sum_{l=0}^{2^n-1} B_{r_l^n, r_{l+1}^n}.$$

Easy step: check  $M_{st}^0 = 0$ .

- 4 ロ ト 4 週 ト 4 差 ト 4 差 ト - 差 - 夕 Q C

# Operator $\Lambda$ : existence (2)

Control of  $M^n - M^{n+1}$ : we have

$$M_{st}^{n} - M_{st}^{n+1} = -\sum_{i=0}^{2^{n}-1} \left( B_{r_{2i}^{n+1}, r_{2i+2}^{n+1}} - B_{r_{2i}^{n+1}, r_{2i+1}^{n+1}} - B_{r_{2i+1}^{n+1}, r_{2i+2}^{n+1}} \right)$$

$$= -\sum_{i=0}^{2^{n}-1} \delta B_{r_{2i}^{n+1}, r_{2i+1}^{n+1}, r_{2i+2}^{n+1}} = -\sum_{i=0}^{2^{n}-1} h_{r_{2i}^{n+1}, r_{2i+1}^{n+1}, r_{2i+2}^{n+1}},$$

Since  $h \in \mathcal{C}_3^{\mu}$  with  $\mu > 1$ , we get

$$\left| M_{st}^n - M_{st}^{n+1} \right| \le \frac{\|h\|_{\mu} (t-s)^{\mu}}{2^{\mu} 2^{n(\mu-1)}},$$

Taking limits: we obtain existence of  $M_{st} \equiv \lim_{n \to \infty} M_{st}^n$ , such that

$$|M_{st}| \leq \frac{\|h\|_{\mu}}{2^{\mu}-2}|t-s|^{\mu}.$$

4□ > 4ⓓ > 4≧ > 4≧ > ½ > ∅

# Operator $\Lambda$ : existence (3)

More general sequences: Consider

- $\{\pi_n; n \ge 1\}$  sequence of partitions of [s, t]
- $\pi_n = \{r_0^n, r_1^n, \dots, r_{k_n}^n, r_{k_n}^n\}$
- $\pi_n \subset \pi_{n+1}$ , and  $\lim_{n\to\infty} k_n = \infty$
- $M_{ts}^{\pi_n} = B_{ts} \sum_{l=0}^{k_n} B_{r_{l+1}^n, r_l^n}$

#### Removing points of a partition:

For  $n \ge 1$ , there exists  $1 \le l \le k_n$  such that

$$|r_{l+1}^n - r_{l-1}^n| \le \frac{2|t-s|}{k_n} \tag{8}$$

Then

- Pick now such an index /
- Transform  $\pi^n$  into  $\hat{\pi}$ , where

$$\hat{\pi} = \left\{ r_0^n, r_1^n, \dots, r_{l-1}^n, r_{l+1}^n, \dots, r_{k_n}^n, r_{k_n+1}^n \right\}.$$

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 42 / 74

# Operator $\Lambda$ : existence (4)

Estimate for the difference: As for dyadic partitions we have

$$M_{ts}^{\hat{\pi}} = M_{ts}^{\pi_n} - (\delta B)_{r_{l+1}^n, r_l^n, r_{l-1}^n} = M_{st}^{\pi_n} - h_{r_{l+1}^n, r_l^n, r_{l-1}^n}.$$

and thus

$$\left|M_{ts}^{\hat{\pi}}-M_{ts}^{\pi_n}\right|\leq 2^{\mu}\|h\|_{\mu}\left(\frac{t-s}{k_n}\right)^{\mu}.$$

Iteration of the estimate: We repeat this operation and

- We end up with the trivial partition  $\hat{\pi}_0 \equiv \{s, t\}$ 
  - $M_{st}^{\hat{\pi}_0} = 0$
  - We obtain

$$|M_{ts}^{\pi_n}| \leq 2^{\mu} ||h||_{\mu} |t-s|^{\mu} \sum_{j=1}^{k_n} j^{-\mu} \leq 2^{\mu} ||h||_{\mu} |t-s|^{\mu} \sum_{j=1}^{\infty} j^{-\mu} \equiv c_{\mu,h} |t-s|^{\mu}.$$

 Samy T. (Purdue)
 Rough Paths 2
 Aarhus 2016
 43 / 74

# Operator $\Lambda$ : existence (5)

#### More general sequences, conclusion: By compactness arguments

- One can find a subsequence  $\{\pi_m; m \ge 1\}$  of  $\{\pi_n; n \ge 1\}$
- ullet It satisfies  $\lim_{m o\infty}M_{ts}^{\pi_m}=M_{ts}$
- ullet  $M_{ts}$ , satisfies  $M_{ts} \leq c_{\mu,h} |t-s|^{\mu}$

#### Uniqueness of the limit: One can show

 $\hookrightarrow$  That the limit does not depend on the sequence of partitions.

↓□▶ ↓□▶ ↓□▶ ↓□▶ □ ♥♀♡

# Operator $\Lambda$ : existence (6)

### Algebraic property:

We wish to show that  $\delta M = h$ .

#### Family of partitions: Consider

- $0 \le s < u < t \le T$
- ullet  $\pi^n_{su}$  sequence of partitions of [s,u] such that  $\lim_{n o 0} |\pi^n_{su}| = 0$
- ullet  $\pi^n_{ut}$  sequence of partitions of [u,t] such that  $\lim_{n o 0} |\pi^n_{ut}| = 0$
- $\bullet \ \pi_{\mathit{st}}^{\mathit{n}} = \pi_{\mathit{su}}^{\mathit{n}} \cup \pi_{\mathit{ut}}^{\mathit{n}}$

Limits along the partitions: One can construct  $\pi^n_{ut}, \pi^n_{su}, \pi^n_{st}$  such that

$$\lim_{m\to\infty}M_{ut}^{\pi_{ut}^n}=M_{ut},\quad \lim_{m\to\infty}M_{su}^{\pi_{su}^n}=M_{su},\quad \lim_{m\to\infty}M_{st}^{\pi_{st}^n}=M_{st}.$$

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 45 / 74

# Operator $\Lambda$ : existence (7)

#### Notation: We call

- ullet  $k_{st}^n$  the number of points of the partition  $\pi_{st}^n$
- $k_{su}^n$  the number of points of the partition  $\pi_{su}^n$
- $\bullet$   $\textit{k}^\textit{n}_\textit{ut}$  the number of points of the partition  $\pi^\textit{n}_\textit{ut}$

### Applying $\delta$ : We have

$$\begin{split} \delta M_{sut}^{\pi_{st}^n} &= M_{st}^{\pi_{st}^n} - M_{su}^{\pi_{su}^m} - M_{ut}^{\pi_{ut}^m} \\ &= \delta B_{sut} - \left( \sum_{l=0}^{k_{st}^n + k_{su}^n - 1} B_{r_l^n r_{l+1}^n} - \sum_{l=0}^{k_{su}^n - 1} B_{r_l^n r_{l+1}^n} - \sum_{l=k_{su}^n}^{k_{su}^m + k_{ut}^m - 1} B_{r_l^m r_{l+1}^m} \right) \\ &= \delta B_{sut} = h_{sut}. \end{split}$$

Taking the limit  $n o \infty$  in the latter relation, we get  $\delta \textit{M}_{\textit{sut}} = \textit{h}_{\textit{sut}}$ 

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 46 / 74

### Outline

- Some basic properties of fBm
- 2 Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

Samy T. (Purdue)

### Expression for smooth functions

Riemann integral: Let  $f, g \in \mathcal{C}^1_1$  $\hookrightarrow \mathcal{J}_{st}(f \, dg)$  defined in Riemann sense and

$$\mathcal{J}_{st}(f dg) \equiv \int_{s}^{t} f_{u} dg_{u} = f_{s} \delta g_{st} + \int_{s}^{t} [f_{u} - f_{s}] dg_{u}$$

$$= f_{s} \delta g_{st} + \int_{s}^{t} \delta f_{su} dg_{u} = f_{s} \delta g_{st} + \mathcal{J}_{st}(\delta f dg).$$

Analysis of  $\mathcal{J}(\delta f dg) \in \mathcal{C}_2$ : for  $s, u, t \in [0, T]$  we have

$$h_{sut} \equiv [\delta (\mathcal{J}(df dg))]_{sut} = \delta f_{su} \delta g_{ut}.$$

Therefore,  $f \in C_1^{\kappa}, g \in C_1^{\gamma} \Rightarrow h \in \mathcal{Z}C_3^{\gamma+\kappa}$ 

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 48 / 74

### Expression for smooth functions (2)

#### We have seen:

If  $\kappa + \gamma > 1$  (smooth case:  $\kappa = \gamma = 1$ ), then  $h \in \mathsf{Dom}(\Lambda)$ Thus (explain convention on products),

$$\mathcal{J}(\delta f \, dg) = \Lambda(h) = \Lambda(\delta f \, \delta g),$$

and we get:

$$\mathcal{J}_{st}(f dg) = f_s \, \delta g_{st} + \Lambda_{st} \left( \delta f \, \delta g \right). \tag{9}$$

Generalization: RHS in (9) makes sense whenever  $\kappa + \gamma > 1$   $\hookrightarrow$  natural extension of the notion of integral

#### Theorem 12.

Let  $f \in \mathcal{C}_1^{\kappa}, g \in \mathcal{C}_1^{\gamma}$ , with  $\kappa + \gamma > 1$ . Define

$$\mathcal{J}_{st}(f dg) = f_s \, \delta g_{st} + \Lambda_{st} \left( \delta f \, \delta g \right). \tag{10}$$

Then:

- If f, g are smooth functions  $\hookrightarrow$  Then  $\mathcal{J}_{st}(f dg) = \text{Riemann integral}$
- ② Generalized integral  $\mathcal{J}(f dg)$  satisfies:

$$|\mathcal{J}_{st}(f dg)| \leq ||f||_{\infty} ||g||_{\gamma} |t-s|^{\gamma} + c_{\gamma,\kappa} ||f||_{\kappa} ||g||_{\gamma} |t-s|^{\gamma+\kappa}.$$

**3**  $\mathcal{J}_{st}(f dg)$  coincides with usual Young integral:

$$\mathcal{J}_{st}(f dg) = \lim_{|\pi_{st}| \to 0} \sum_{i=0}^{n-1} f_{t_i} \, \delta g_{t_i t_{i+1}}.$$

### **Proof**

Claim 1: Already obtained at (9)

Claim 2: Recall that

$$\mathcal{J}_{st}(f dg) = f_s \, \delta g_{st} + \Lambda_{st} \left( \delta f \, \delta g \right).$$

Hence, setting  $h = \delta f \delta g$ :

$$|f_{s} \, \delta g_{st}| \leq \|f\|_{\infty} \|g\|_{\gamma} |t-s|^{\gamma}$$

$$|\Lambda_{st} \left(\delta f \, \delta g\right)| \leq c_{\gamma,\kappa} \|h\|_{\gamma+\kappa} |t-s|^{\gamma+\kappa} \leq c_{\gamma,\kappa} \|f\|_{\kappa} \|g\|_{\gamma} |t-s|^{\gamma+\kappa}$$

4□ > 4ⓓ > 4≧ > 4≧ > ½ > ∅

Samy T. (Purdue)

# Proof (2)

#### Claim 3:

Recall: that, if  $\delta\ell\in\mathcal{C}_3^{\mu}$  with  $\mu>1$ ,

$$k = (\operatorname{Id} - \Lambda \delta)\ell \quad \Rightarrow \quad k_{st} = \lim_{|\pi_{st}| \to 0} \sum_{i=0}^{n} \ell_{t_i t_{i+1}}$$

Application: take  $\ell=f\delta g$ , namely  $\ell_{st}=f_s\,\delta g_{st}\Rightarrow\delta\ell=-\delta f\,\delta g$ 

Conclusion: we have

$$f_s \, \delta g_{st} + \Lambda_{st} \, (\delta f \, \delta g) = f_s \, \delta g_{st} - \Lambda_{st} \, (\delta (f \, \delta g)) = [\operatorname{Id} - \Lambda \delta](f \, \delta g)$$

$$= \lim_{|\pi_{st}| \to 0} \sum_{i=0}^{n} f_{t_i} \, \delta g_{t_i t_{i+1}}$$

### Outline

- Some basic properties of fBm
- Simple Young integration
- Increments
- 4 Algebraic Young integration
- Differential equations

Samy T. (Purdue)

### Pathwise strategy (repeated)

Aim: Let x be a function in  $C_1^{\gamma}$  with  $\gamma > 1/2$ . We wish to define and solve an equation of the form:

$$y_t = a + \int_0^t \sigma(y_s) \, dx_s \tag{11}$$

### Steps:

- Define an integral  $\int z_s dx_s$  for  $z \in \mathcal{C}_1^{\kappa}$ , with  $\kappa + \gamma > 1$
- $\bullet$  Solve (11) through fixed point argument in  $\mathcal{C}_1^{\kappa}$  with  $1/2<\kappa<\gamma$

Remark: We treat a real case and  $b \equiv 0$  for notational sake.

- 4 ロ ト 4 個 ト 4 差 ト 4 差 ト - 差 - 夕 Q (C)

### Existence-uniqueness result

#### Theorem 13.

#### Consider

- Noise:  $x \in \mathcal{C}_1^{\gamma} \equiv \mathcal{C}_1^{\gamma}([0, T])$ , with  $\gamma > 1/2$
- Coefficient:  $\sigma:\mathbb{R}\to\mathbb{R}$  a  $C_b^2$  function
- Equation:  $\delta y = \mathcal{J}(\sigma(y) dx)$

#### Then:

- Our equation admits a unique solution y in  $C_1^{\kappa}$  for any  $1/2 < \kappa < \gamma$ .
- **②** Application  $(a, x) \mapsto y$  is continuous from  $\mathbb{R} \times \mathcal{C}_1^{\gamma}$  to  $\mathcal{C}_1^{\kappa}$ .

### Fixed point: strategy

#### A map on a small interval:

Consider an interval  $[0, \tau]$ , with  $\tau$  to be determined later

Consider  $\kappa$  such that  $1/2 < \kappa < \gamma < 1$ 

In this interval, consider  $\Gamma: \mathcal{C}_1^{\kappa}([0,\tau]) \to \mathcal{C}_1^{\kappa}([0,\tau])$  defined by:  $\Gamma(z) = \hat{z}$ , with  $\hat{z}_0 = a$ , and for  $s, t \in [0,\tau]$ :

$$\delta \hat{z}_{st} = \int_{s}^{t} \sigma(z_r) dx_r = \mathcal{J}_{st}(\sigma(z) dx)$$

Aim: See that for a small enough  $\tau$ , the map  $\Gamma$  is a contraction  $\hookrightarrow$  our equation admits a unique solution in  $\mathcal{C}_1^{\kappa}([0,\tau])$ 

 Samy T. (Purdue)
 Rough Paths 2
 Aarhus 2016
 56 / 74

### Contraction argument in $[0, \tau]$

### Definition of 2 processes:

Let  $z^1,z^2\in\mathcal{C}_1^\kappa([0, au]).$  Define  $\hat{z}^i=\Gamma(z^i).$  Then

$$\delta(\hat{z}^1 - \hat{z}^2)_{st} = \int_s^t \left[ \sigma(z_r^1) - \sigma(z_r^2) \right] dx_s = \mathcal{J}_{st} \left( \left[ \sigma(z^1) - \sigma(z^2) \right] dx \right)$$

#### Evaluation of the difference:

$$\begin{aligned} \left| \mathcal{J}_{st}(\left[ \sigma(z^1) - \sigma(z^2) \right] dx) \right| &\leq \| \sigma(z^2) - \sigma(z^1) \|_{\infty} \| x \|_{\gamma} |t - s|^{\gamma} \\ &+ c_{\gamma,\kappa} \| \sigma(z^2) - \sigma(z^1) \|_{\kappa} \| x \|_{\gamma} |t - s|^{\gamma + \kappa} \end{aligned}$$

Important step: Control of

$$\|\sigma(z^2) - \sigma(z^1)\|_{\kappa}$$

◄□▶◀圖▶◀불▶◀불▶ 불 ∽Q҈

# Control of $\|\sigma(z^2) - \sigma(z^1)\|_{\kappa}$

### Lemma 14.

Let 
$$\sigma\in\mathcal{C}^2_b$$
. We have 
$$\|\sigma(z^2)-\sigma(z^1)\|_\kappa\leq c_{\sigma,\tau}\left(1+\|z^1\|_\kappa+\|z^2\|_\kappa\right)\|z^2-z^1\|_\kappa$$

Problem: Application  $\sigma: \mathcal{C}_1^{\kappa}([0,\tau]) \to \mathcal{C}_1^{\kappa}([0,\tau])$ is only locally Lipschitz

Solution: Decomposition of the fixed point argument:

- $lue{f 0}$  If au small enough and m M large enough: existence of an invariant ball B(0, M) by map  $\Gamma$  in  $C_{1,a}^{\kappa}([0, \tau])$
- Within the invariant ball, usual contraction argument

Samy T. (Purdue) Aarhus 2016 58 / 74

### Invariant ball

#### Lemma 15.

Let  $\tau < c^{-1/\gamma}$ , where  $c = c(\gamma, \kappa, \|\sigma\|_{\infty}, \|\sigma'\|_{\infty}, \|x\|_{\gamma})$ . Let  $M \geq [c\tau^{\gamma-\kappa}]/[1-c\tau^{\gamma}]$ . Then ball B(0, M) in  $\mathcal{C}^{\kappa}_{1,a}([0, \tau])$  is invariant by  $\Gamma$ .

#### Proof: Start from our bound:

$$\begin{aligned} &|\mathcal{J}_{\mathsf{st}}(\sigma(\mathsf{z})\mathsf{d}\mathsf{x})| \leq \|\sigma(\mathsf{z})\|_{\infty} \|\mathsf{x}\|_{\gamma} |\mathsf{t} - \mathsf{s}|^{\gamma} + c_{\gamma,\kappa} \|\sigma(\mathsf{z})\|_{\kappa} \|\mathsf{x}\|_{\gamma} |\mathsf{t} - \mathsf{s}|^{\gamma+\kappa} \\ &\leq \|\sigma\|_{\infty} \|\mathsf{x}\|_{\gamma} |\mathsf{t} - \mathsf{s}|^{\kappa} \tau^{\gamma-\kappa} + c_{\gamma,\kappa} \|\sigma'\|_{\infty} \|\mathsf{z}\|_{\kappa} \|\mathsf{x}\|_{\gamma} |\mathsf{t} - \mathsf{s}|^{\kappa} \tau^{\gamma} \\ &\leq c_{\gamma,\kappa,\sigma} \|\mathsf{x}\|_{\gamma} \left[\tau^{\gamma-\kappa} + \|\mathsf{z}\|_{\kappa} \tau^{\gamma}\right] |\mathsf{t} - \mathsf{s}|^{\kappa} \\ &\leq c \left[\tau^{\gamma-\kappa} + \|\mathsf{z}\|_{\kappa} \tau^{\gamma}\right] |\mathsf{t} - \mathsf{s}|^{\kappa} \end{aligned}$$

59 / 74

Samy T. (Purdue) Aarhus 2016

### Invariant ball: proof

Inequality for M: We have seen

$$\|\Gamma(z)\|_{\kappa} \le c \left[\tau^{\gamma-\kappa} + \|z\|_{\kappa}\tau^{\gamma}\right].$$

Hence, if M satisfies:

$$c\left[\tau^{\gamma-\kappa}+M\tau^{\gamma}\right]\leq M,\tag{12}$$

ball B(0, M) invariant by  $\Gamma$ .

#### Remark:

We have used  $\gamma > \kappa$  in order to gain a contraction factor  $\tau^{\gamma - \kappa}$ 

- 4 ロ ト 4 個 ト 4 恵 ト 4 恵 ト - 恵 - からで

### Invariant ball: proof (2)

Solving (12): Write

$$(12) \Longleftrightarrow c \left[ \tau^{\gamma - \kappa} + M \tau^{\gamma} \right] \leq M \Longleftrightarrow M \left( 1 - c \tau^{\gamma} \right) \geq c \, \tau^{\gamma - \kappa}$$

First condition on  $\tau$ :  $c\tau^{\gamma} \leq \frac{1}{2}$ . Then a sufficient condition for (12) is

$$M > 2c \, \tau^{\gamma - \kappa}$$

Second condition on  $\tau$ : We take M=1 and  $\tau \leq \left(\frac{1}{2c}\right)^{\frac{1}{\gamma-\kappa}}$ 

Conclusion: Relation (12) satisfied and B(0,1) invariant if

$$\tau \leq \left(\frac{1}{2c}\right)^{\frac{1}{\gamma}} \wedge \left(\frac{1}{2c}\right)^{\frac{1}{\gamma - \kappa}} \equiv \tau_1(\gamma, \kappa, \sigma, \|x\|_{\gamma})$$

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 61 / 74

### Contraction argument in $[0, \tau_1]$

Recall: Setting  $K_{st} \equiv \mathcal{J}_{st}([\sigma(z^1) - \sigma(z^2)] dx)$ , we have seen

$$\begin{aligned} |\mathcal{K}_{st}| &\leq \|\sigma(z^2) - \sigma(z^1)\|_{\infty} \|x\|_{\gamma} |t - s|^{\gamma} \\ &+ c_{\gamma,\kappa} \|\sigma(z^2) - \sigma(z^1)\|_{\kappa} \|x\|_{\gamma} |t - s|^{\gamma + \kappa} \end{aligned}$$

#### Bounds on Hölder norms:

On  $[0, \tau_2]$  with  $\tau_2 \leq \tau_1$  we have (cf Lemma 14)

$$\|\sigma(z^2) - \sigma(z^1)\|_{\kappa} \le 3c_{\sigma,\tau_2}\|z^2 - z^1\|_{\kappa}$$

and

$$\begin{split} \|\sigma(z^{2}) - \sigma(z^{1})\|_{\infty} & \leq c_{\sigma} \|z^{2} - z^{1}\|_{\infty} \\ & \leq c_{\sigma} \tau_{2}^{\kappa} \|z^{2} - z^{1}\|_{\kappa} \\ & = c_{\sigma, \tau_{2}} \|z^{2} - z^{1}\|_{\kappa} \end{split}$$

### Contraction argument in $[0, \tau_1]$ (2)

Bound on K: Owing to previous computations we get

$$|K_{st}| \le c_{\sigma, \tau_2} ||x||_{\gamma} \tau_2^{\kappa} ||z^2 - z^1||_{\gamma} |t - s|^{\gamma}$$

Recall: Let  $z^1, z^2 \in \mathcal{C}^\kappa_1([0,\tau_2])$ . Define  $\hat{z}^i = \Gamma(z^i)$ . Then

$$\delta(\hat{z}^1 - \hat{z}^2)_{st} = K_{st}$$

Contraction: We have obtained

$$\|\Gamma(z^2) - \Gamma(z^1)\|_{\gamma} \le c_{\sigma,\tau_2} \|x\|_{\gamma} \tau_2^{\kappa} \|z^2 - z^1\|_{\gamma}$$

Considering  $\tau_2 \leq \inf\{\tau_1, (2c_{\sigma,\tau_2}||x||_{\gamma})^{-1/\kappa}\}$  this yields

$$\|\Gamma(z^2) - \Gamma(z^1)\|_{\gamma} \le \frac{1}{2} \|z^2 - z^1\|_{\gamma}$$

# Contraction argument in $[0, \tau_1]$ (3)

#### Existence-uniqueness on a small interval:

Thanks to Banach-Steinhaus, for

$$\tau_2 \leq \inf \left\{ \tau_1, \, \frac{1}{(2c_{\sigma,\tau_2} \|x\|_{\gamma})^{1/\kappa}} \right\},\,$$

we get unique solution of (11) in  $\mathcal{C}^\kappa_{1,a}([0, au_2])$ 

# From $[0, \tau]$ to $[\tau, 2\tau]$

New map  $\Gamma$ : In  $[\tau, 2\tau]$ , consider the map

$$\Gamma: \mathcal{C}_1^{\kappa}([\tau, 2\tau]) \to \mathcal{C}_1^{\kappa}([\tau, 2\tau])$$

defined by:  $\Gamma(z) = \hat{z}$ , with  $\hat{z}_{\tau} = a_{\tau}$ , where

- $a_{ au} \equiv$  final value of the solution in [0, au]
- For  $s,t \in [ au,2 au]$ ,  $\delta \hat{\mathsf{z}}_{\mathsf{st}} = \mathcal{J}_{\mathsf{st}}(\mathsf{z}\,\mathsf{d}\mathsf{x})$

New fixed point argument: the same fixed point arguments yield a unique solution y of  $y_t = a_\tau + \int_\tau^t f(y_s) dx_s$  in  $C_1^\kappa([\tau, 2\tau])$ .

#### Remark:

In order to use the very same arguments, need a bound on  $\sigma,\sigma',\sigma''$ 

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 65 / 74

# Continuity with respect to initial condition (1)

#### Notation: We set

- y<sup>a</sup> solution of equation (11) with initial condition a
- $a_1, a_2$  two initial conditions
- $z = y^{a_2} y^{a_1}$

#### Equation for z:

$$\delta z_{st} = \left[\sigma(y_u^{a_1}) - \sigma(y_u^{a_2})\right] \delta x_{st} + \Lambda \left(\delta \left[\sigma(y_u^{a_1}) - \sigma(y_u^{a_2})\right] \delta x\right)$$

Samy T. (Purdue)

# Continuity with respect to initial condition (2)

Notation: Set, for  $\tau_1 > 0$ ,

- $||w||_{\gamma} = ||w||_{\gamma,[0,\tau_1]}$  for a path w
- $Z_s = \sup_{r \le s} |z_s|$
- $c_1 = c_{\sigma} ||x||_{\gamma}$
- $c_2 = c_{\kappa,\gamma,\sigma} \left(1 + \|y^{a_1}\|_{\kappa} + \|y^{a_2}\|_{\kappa}\right) \|x\|_{\gamma}$

Bound for z: We get

$$\|\delta z_{st}\| \leq c_1 Z_s |t-s|^{\gamma} + c_2 \|z\|_{\kappa} |t-s|^{\gamma+\kappa}$$

Bound for Z: We trivially have

$$Z_s \le |a^1 - a^2| + ||z||_{\kappa} \, \tau_1^{\kappa}$$

### Continuity with respect to initial condition (3)

Bound for the Hölder norm of z: We have

$$||z||_{\kappa} \leq c_{1}\tau_{1}^{\gamma-\kappa} \left(|a^{1}-a^{2}|+||z||_{\kappa}\tau_{1}^{\kappa}\right) + c_{2}||z||_{\kappa}\tau_{1}^{\gamma}$$
  
$$\leq c_{1}\tau_{1}^{\gamma-\kappa}|a^{1}-a^{2}|+(c_{1}+c_{2})\tau_{1}^{\gamma}||z||_{\kappa}$$

Choosing  $\tau_1$ : such that  $\tau_1 \leq 1$  and

$$au_1 = \left(rac{c_3}{1+\|\mathbf{x}\|_{\gamma}}
ight)^{rac{1}{\gamma}} \quad \Longrightarrow \quad (c_1+c_2) au_1^{\gamma} = rac{1}{2}$$

Conclusion on a small interval: On  $[0, \tau_1]$  we have

$$||z||_{\kappa; [0,\tau_1]} \leq 2c_1\tau_1^{\gamma-\kappa}|a^1-a^2| |z_{\tau_1}| \leq |z_0|+\tau_1^{\gamma}||z||_{\gamma; [0,\tau_1]} \leq (1+c_4\tau_1^{\gamma})|a^1-a^2|$$

Samy T. (Purdue) Rough Paths 2 Aarhus 2016 68 / 74

### Continuity with respect to initial condition (4)

Iteration of the estimate: For  $j \geq 0$  and setting  $d_{\scriptscriptstyle X} = 1 + c_4 au_1^\gamma$  we get

$$||z||_{\kappa;\,[j\tau_1,(j+1)\tau_1]} \le d_x^j |a^1 - a^2|$$

Patching small interval estimates: Consider

$$j\tau_1 \le s < (j+1)\tau_1 < k\tau_1 \le t < (k+1)\tau_1$$

Then

$$|\delta z_{st}| \le |\delta z_{s,(j+1)\tau_1}| + \sum_{l=j+1}^{k-1} |\delta z_{l\tau_1,(l+1)\tau_1}| + |\delta z_{k\tau_1,t}|$$

### Continuity with respect to initial condition (5)

#### Patching small interval estimates, ctd:

$$egin{aligned} & rac{|\delta z_{st}|}{|a^1-a^2|} \leq d_x^j |(j+1) au_1-s|^\gamma + \sum_{l=j+1}^{k-1} d_x^l au_1^\gamma + d_x^k |t-k au_1|^\gamma \ & \leq d_x^j |(j+1) au_1-s|^\gamma + d_x^{j+1} \, rac{d_x^{k-j-1}-1}{d_x-1} \, au_1^\gamma + d_x^k |t-k au_1|^\gamma \ & \leq c_5 \, d_x^k \, \left(|(j+1) au_1-s|^\gamma + au_1^\gamma + |t-k au_1|^\gamma
ight) \ & \leq c_6 \, d_x^k \, |t-s|^\gamma \end{aligned}$$

70 / 74

Samy T. (Purdue) Rough Paths 2 Aarhus 2016

### Continuity with respect to initial condition (6)

Bound on k: In previous computations,

$$k\tau_1 \leq T \implies k \leq \frac{T}{\tau_1}$$

Conclusion for Hölder's norm: We have obtained

$$||z||_{\gamma; [0,T]} \le c_6 d_x^{T/\tau_1} |a^1 - a^2| = c_6 \exp\left(\frac{T}{\tau_1} \ln(d_x)\right) |a^1 - a^2|$$
  
 $\le c_6 \exp\left(c_7 (1 + ||x||_{\gamma})^{1/\gamma}\right) |a^1 - a^2|$ 

Continuity proved!

Samy T. (Purdue) Rough Paths 2 Aarhus 2016

# Control of $\|\sigma(z^2) - \sigma(z^1)\|_{\kappa}$ (repeated)

Let 
$$\sigma \in C_b^2$$
. We have 
$$\|\sigma(z^2) - \sigma(z^1)\|_{\kappa} \le c_{\sigma,\tau} \left(1 + \|z^1\|_{\kappa} + \|z^2\|_{\kappa}\right) \|z^2 - z^1\|_{\kappa}$$

Proof: For  $\lambda, \mu \in [0, 1]$ , define the path

$$a(\lambda, \mu) = z_s^1 + \lambda \left( z_t^1 - z_s^1 \right) + \mu \left( z_s^2 - z_s^1 \right) + \lambda \mu \left( z_t^2 - z_s^2 - z_t^1 + z_s^1 \right)$$

Then

$$a(0,0) = z_s^1, \quad a(0,1) = z_s^2, \quad a(1,0) = z_t^1, \quad a(1,1) = z_t^2$$

Samy T. (Purdue) Aarhus 2016

72 / 74

### **Proof**

Let  $G(\lambda, \mu) \equiv \sigma(a(\lambda, \mu))$ , and

$$\Delta_{st}^{12} \equiv \left[\sigma(z_t^2) - \sigma(z_t^1)\right] - \left[\sigma(z_s^2) - \sigma(z_s^1)\right]$$

We have:

$$\Delta_{st}^{12} = G(1,1) - G(1,0) - G(0,1) + G(0,0) = \int_0^1 \int_0^1 \partial_{\lambda,\mu}^2 G \, d\lambda d\mu$$

Set  $\hat{z} \equiv z^2 - z^1$  and compute:

$$\begin{split} \partial_{\lambda,\mu}^2 G &= \partial_{\lambda,\mu}^2 a \, \sigma'(a) + \partial_{\lambda} a \, \partial_{\mu} a \, \sigma''(a) \\ \partial_{\lambda} a &= \mu \, \delta z_{st}^2 + [1 - \mu] \, \delta z_{st}^1 \\ \partial_{\mu} a &= \lambda \hat{z}_t + [1 - \lambda] \hat{z}_s \\ \partial_{\lambda,\mu}^2 a &= \delta \hat{z}_{st} \end{split}$$

73 / 74

Samy T. (Purdue) Rough Paths 2 Aarhus 2016

# Proof (2)

Thus:

$$\begin{split} |\partial_{\lambda}a| &= \left|\mu\,\delta z_{st}^2 + [1-\mu]\,\delta z_{st}^1\right| \leq \left[\|z^1\|_{\kappa} + \|z^2\|_{\kappa}\right]|t-s|^{\kappa} \\ |\partial_{\mu}a| &= |\lambda\hat{z}_t + [1-\lambda]\hat{z}_s| \leq \|z^1 - z^2\|_{\kappa}\,\,\tau^{\kappa} \\ |\partial_{\lambda,\mu}^2a| &= |\delta\hat{z}_{st}| \leq \|z^1 - z^2\|_{\kappa}|t-s|^{\kappa}, \end{split}$$

and

$$\begin{array}{lcl} \partial_{\lambda,\mu}^2 \mathsf{G} & = & \left| \partial_{\lambda,\mu}^2 \mathsf{a} \, \sigma'(\mathsf{a}) + \partial_{\lambda} \mathsf{a} \, \partial_{\mu} \mathsf{a} \, \sigma''(\mathsf{a}) \right| \\ & \leq & \left| \partial_{\lambda,\mu}^2 \mathsf{a} \right| \; \|\sigma'\|_{\infty} + |\partial_{\lambda} \mathsf{a}| \; |\partial_{\mu} \mathsf{a}| \; \|\sigma''\|_{\infty} \end{array}$$

The result is now easily deduced.
